**Erratum to: Biological Invasions**

**DOI 10.1007/s10530-014-0759-1**

The original version of this article contained an error which may affect interpretation of the data. In Fig. 4, rough grass was important at a scale of 225m, rather than 225mm. The corrected figure can be found below.

**Fig. 4** Relative importance of explanatory variables in explaining the occurrence of: **a)** European hare and **b)** Irish hare in the landscape at multiple spatial scales (extracted from buffers ranging from 225m to 5km). Variables were ranked in order of the sum of their Akaike weights ( $\sum \omega_i$ ) within the top set of models i.e. models with  $\Delta AIC \leq 2$ . Black bars indicate those variables that were retained in the best single approximating model (i.e. that with the lowest AIC value) and grey bars indicate variables included in all other models within the top set. Standardised  $\beta$  values  $\pm$  standard errors are given to the right of each bar and  $p$  values of each variable in the top model are denoted as \*  $p < 0.05$ , \*\*  $p < 0.01$  and \*\*\*  $p < 0.001$ . **c)** Grass fibre content (%)  $\pm$  1 standard error (SE) at locations where European and Irish hares were present with associated pseudo-absences. Insert shows the negative correlation between grass fibre and sugar content as a percentage of dry mass.
